Could label this one operations.

- Your average friend has more friends than you.
- The average person you see at the gym is at the gym more than you are.
- The average line is 5 people, yet the average wait is 6 minutes (nobody is benefitting from the empty line).
- The average teacher's class size is less than the average student class size.
- Average time until a subway arrives is 3 minutes, but average person's wait is longer.

Relates to the “size bias” distribution.
