Blog about

- favorite long shot bias
- why decreased probability of admission to college causes more (rather than fewer) applications,
- polya's urn
- martingales.
- Monotonicity in auctions (can adding a new bidder decrease revenue?) In SPA, no. In APA, yes. In Lottery, no. (see "Lottery versus all-pay auction models of lobbying" by Fang). In FPA?
- Brae's paradox (spring/traffic congestion). Think of complements/substitutes.
- Prisoner/box game (permutations), and other math puzzles.
- Importance sampling
- Little's law (from May 3, 2016): All the time, we try to infer wait times from lines. Little's law says that $(\# \text{ in system}) = (\text{arrival rate}) \times (\text{time in system})$. At food truck, I saw small number in system, tried to infer time in system. Thought that time would be quick, but in fact, arrival rate was small, and time in system was large. (Thus, my sandwich was slow in coming).
- - If you can't explain the math in English, it's either irrelevant to the real world or you don't understand it.
 - If you can't express the English in Math, it's either flawed or you don't understand it.
